

ABSTRACT OF THE DISCLOSURE

An image forming apparatus including a sheet conveying apparatus. When a sheet is jammed in a first conveying path, a first unit is pulled out in a direction substantially parallel to a first conveying path. In this way, a driven roller and a driving roller are separated from each other, and a work space is created. The jammed sheet is thus exposed to the first conveying path. It is therefore easy to put a hand into the work space and remove the sheet. This allows for easy maintenance, and easy operation for removing a sheet retained in the apparatus.
